EDUCATION

Kasetsart University

Bangkok, Thailand

2022 - 2025

Bachelor of Science (B.S.) in Statistics | Major: Statistics | Cumulative GPA: 3.43/4.00 (Second Class Honors)

SKILLS

Data Science: Statistical Modeling and Analysis, Data Visualization, Data Wrangling

Programming: Python, R, Stata, Minitab, SPSS, Microsoft Excel

Soft Skills: Adaptability, Analytical Thinking, Collaboration, Communication, Problem-Solving

WORK EXPERIENCE

Division of Infectious Diseases, Department of Pediatrics, and Center of Excellence in Pediatric

Bangkok, Thailand

Infectious Diseases and Vaccines, Faculty of Medicine, Chulalongkorn University

April - June 2025

Research Trainee

- **RSV Prophylaxis Project**—Analyzed medical costs, length of stay, and oxygen therapy requirements across risk groups using descriptive statistics, comparing outpatient (OPD) and inpatient (IPD) records.
- **Remdesivir Use in Pediatric COVID-19 Project**—Conducted statistical analysis in Stata, including chi-square tests and univariate and stepwise multivariate logistic regression, to assess predictors of disease severity among patients aged up to 18 years.

Buddy CU Clinic, Center of Excellence for Pediatric Infectious Diseases and Vaccines,

Bangkok, Thailand

Faculty of Medicine, Chulalongkorn University

January 2025 - April 2026

Survey and Data Analyst

- **Assessing Youth Knowledge and Understanding of Sexual Health**—A survey was conducted among youth aged 15–24 years from Suankularb Wittayalai School and Kasetsart University via Google Forms. The results were utilized to develop targeted educational materials and youth engagement strategies.
 - **A Survey of Adolescent and Youth Perspectives on Condom Use**—A survey was conducted via Google Forms, targeting youth aged 15–24 years in Bangkok. The data was analyzed using Stata to identify factors contributing to the non-use of condoms during sexual intercourse, employing both descriptive statistics and Chi-square tests.

ACADEMIC PROJECTS

Portfolio website: <https://adisakdadjam.github.io/> (for additional information and projects)

A Comparison of Test Statistics for the Equality of Covariance Matrices in High-Dimensional Data and an Application to Microarray Data

- Simulated high-dimensional multivariate normal data under five covariance structures using Python.
- Compare performance of five test statistics for testing the equality of covariance matrices, evaluated based on their ability to control the type I error rate and their power.
- Calculate the test statistics that are able to control type I error rate using the gene expression dataset of glioma samples obtained from the NCBI Gene Expression Omnibus (GEO), with a total of 24785 variables and a sample size of 180, divided into 4 groups.
- Prepared the results in the form of a full report, an English research article, and a poster for the NovaSciKU 2026.

Factor Association of Mortality Risk Among People Living with HIV Antiretroviral Therapy Initiation in Thailand: A Stratified Cox Proportional Hazards Model

- Analyzed time-to-event data among people living with HIV initiating antiretroviral therapy (ART) in Thailand with a sample size of 49488 from 2021 to 2022.
- Estimated survival probability in Stata using Kaplan–Meier curves and log-rank tests to compare survival probabilities across clinical characteristics.
- Refined the Cox regression model by applying a stratified Cox proportional hazards approach to identify factors associated with mortality risk among people living with HIV initiating antiretroviral therapy (ART) in Thailand, achieving 82.25% AUC.
- Prepared the results as a poster presentation for a medical statistics class.
